Other Site Characteristics

l'area è caratterizzata da zone di spartiacque con culminazioni e da zone di fondovalle con vari torrenti. Affiorano le dolomie di S. Pietro dei Monti, i porfiroidi del Melogno, filladi, micascisti e scisiti quarzosi.

4.2 Quality and importance

Sito importante per i contrasti floristici e vegetazionali legati alle differenze dei substrati geologici (tra i quali appaiono fortemente condizionanti i calcari dolomitici) e delle esposizioni che permettono a breve distanza dal mare e a quote basse la presenza di frammenti di caluneto e di faggeta. In buon stato di conservazione sono alcuni aspetti di macchia mediterranea e di sughereta. Sono presenti habitat e specie (Campanula sabatia) di interesse prioritario, specie dell'allegato II (92/43 CEE), altre specie endemiche, rare, al limite nord-orientale della distribuzione o protette ai sensi di direttive/convenzioni internazionali. Si segnala la presenza di Convolvulus sabatius, specie relictiva paleomediterranea, proposta dalla Regione Liguria per l'inclusione nell'All. II della direttiva 92/43 CEE come specie prioritaria. E' presente anche Pelodytes punctatus, specie rinvenibile in pochissime stazioni italiane, che è stata proposta (limitatamente alle popolazioni italiane) come prioritaria per la 92/43 CEE.
